Description

Background of the Invention

Field of the Invention

[0001] This invention relates generally to the field of wells, particularly to the field of establishing branch wells from a parent hydrocarbon well. More particularly the invention relates to establishing multiple branch wells from a common depth point, called a node, deep in the well.

Description of the Related Art

[0002] Multiple wells have been drilled from a common location, particularly while drilling from an offshore platform where multiple wells must be drilled to cover the great expenses of offshore drilling. As illustrated in Figures 1A and 1B, such wells are drilled through a common conductor pipe, and each well includes surface casing liners, intermediate casing and parent casing as is well known in the field of offshore drilling of hydrocarbon wells.

[0003] Branch wells are also known in the art of well drilling as illustrated in Figure 2. Branch wells are created from the parent well, but necessarily the parent well extends below the branching point of the primary well. As a result, the branching well is typically of a smaller diameter than that of the primary well which extends below the branching point. Furthermore, difficult sealing problems have faced the art for establishing communication between the branch well and the primary well.

[0004] For example, U.S. Patent 5,388,648 describes methods relating to well juncture sealing with various sets of embodiments to accomplish such sealing. The disclosure of the 648 patent proposes solutions to several serious sealing problems which are encountered when establishing branches in a well. Such sealing problems relate to the requirement of ensuring the connectivity of the branch casing liner with the parent casing and to maintaining hydraulic isolation of the juncture under differential pressure.

[0005] U.S. Patent 5,330,007 describes a template and process for drilling and completing multiple wells from a single parent well. The template disclosed in the '007 patent is of the same size as the parent well casing and incorporates multiple bores which are oriented at slight angles relative to one another. As the template is not expandable, the diameters of the multiple wells which may be drilled out of the template are collectively limited by the diameter of the parent casing.

[0006] A fundamental problem exists in establishing branch wells at a depth in a primary well in that apparatus for establishing such branch wells must be run on parent casing which must fit within intermediate casing of the well. Accordingly, any such apparatus for establishing branch wells must have an outer diameter which

is essentially no greater than that of that the parent casing. Furthermore, it is desirable that when branch wells are established, they have as large a diameter as possible. Still further, it is desirable that such branch wells be lined with casing which may be established and sealed with the branching equipment with conventional casing hangers.

[0007] An important object of this invention is to provide an improved apparatus and method by which multiple branches connect to a primary well at a single depth in the well.

Summary of the Invention

[0008] These objects and other advantages and features are provided in a method and apparatus for establishing multiple branch wells from a parent well. A multiple branching sub is provided for deployment in a borehole by means of a parent casing through a parent well. The branching sub includes a branching chamber which has an open first end of cylindrical shape. The branching chamber has a second end to which branching outlet members are connected. The first end is connected to the parent well casing in a conventional manner, such as by threading, for deployment to a branching location in the parent well.

[0009] Multiple branching outlet members, each of which is integrally connected to the second end of the branching chamber, provide fluid communication with the branching chamber. Each of the outlet members is prefabricated such that such members are in a retracted position for insertion of the sub into and down through the parent well to a deployment location deep in the well. Each of the multiple outlets is substantially totally within an imaginary cylinder which is coaxial with and of substantially the same radius as the first end of the branching chamber. The prefabrication of the outlet members causes each outlet member to be transformed in cross-sectional shape from a round or circular shape to an oblong or other suitable shape such that its outer profile fits within the imaginary cylinder. The outer profile of each outlet member cooperates with the outer profiles of other outlet members to substantially fill the area of a cross-section of the imaginary cylinder. As a result, a substantially greater cross-sectional area of the multiple outlet members is achieved within a cross-section of the imaginary cylinder as compared with a corresponding number of tubular multiple outlet members of circular cross-section.

[0010] The multiple outlet members are constructed of a material which may be plastically deformed by cold forming. A forming tool is used, after the multiple branching sub is deployed in the parent well, to expand at least one of the multiple branching outlet members outwardly from the connection to the branching chamber. Preferably all of the outlet members are expanded simultaneously. Simultaneously with the outward expansion, the multiple outlets are expanded into a substantially circu-

lar radial cross-sectional shape along their axial extent.

[0011] After the multiple outlet members which branch from the branching chamber are expanded, each of the multiple branching outlets are plugged. Next, a borehole is drilled through a selected one of the multiple branching outlets. A substantially round liner is provided through the selected branching outlet and into the branch well. The liner of circular cross-section is sealed to the selected branching outlet circular cross-section by means of a conventional casing hanger. A borehole and liner is established for a plurality of the multiple branching outlets. A downhole manifold is installed in the branching chamber. Next multiple branch wells are completed. The production of each branch well to the parent well is controlled with the manifold.

[0012] The apparatus for expanding an outlet of the multiple branching sub includes an uphole power and control unit and a downhole operational unit. An electrical wireline connects the uphole power and control unit and the downhole operational unit. The wireline provides a physical connection for lowering the downhole operational unit to the branching sub and provides an electrical path for transmission of power and bidirectional control and status signals.

[0013] The downhole operational unit includes a forming mechanism arranged and designed for insertion in at least one retracted branching outlet member of the sub (and preferably into all of the outlet members at the same time) and for expanding the outlet member outwardly from its imaginary cylinder at deployment. Preferably each outlet member is expanded outwardly and expanded to a circular radial cross-section simultaneously. The downhole operational unit includes latching and orientation mechanisms which cooperate with corresponding mechanisms of the sub. Such cooperating mechanisms allow the forming mechanism to be radially oriented within the multiple branching sub so that it is aligned with a selected outlet of the sub and preferably with all of the outlets of the sub. The downhole operational unit includes a hydraulic pump and a head having hydraulic fluid lines connected to the hydraulic pump. The forming mechanism includes a hydraulically powered forming pad. A telescopic link between each forming pad and head provides pressurized hydraulic fluid to the forming pads as they move downwardly while expanding the outlet members.

Brief Description of the Drawings

[0014] The objects, advantages and features of the invention will become more apparent by reference to the drawings which are appended hereto and wherein an illustrative embodiment of the invention is shown, of which:

Figures 1A and 1B illustrate a prior art triple liner packed in a conductor casing termination in which the outlet members are round during installation

and are packed to fit within the conductor casing; Figure 2 illustrates a prior art parent or vertical well and lateral branch wells which extend therefrom; Figures 3A, 3B, and 3C illustrate a three outlet branching sub according to the present invention where Figure 3A is a radial cross-section through the branching outlets of the sub, with one outlet completely in a retracted position, with another outlet in a position between its retracted position and its fully expanded position, and the third outlet being in a fully expanded position, and where Figure 3B is a radial cross-section through the branching outlets of the sub with each of the outlets fully expanded after deployment in a parent well, and Figure 3C is an axial cross-section of the branching sub showing two of the branching outlets fully expanded to a round shape in which casing has been run into a branch well and sealed with respect to the branching outlets by means of conventional liner hanging packers.

Figure 4 is a perspective view of a three symmetrical outlet branching sub of the present invention with the outlet branches expanded.

Figures 5A, 5B, 5C, and 5D illustrate configurations of the present invention with asymmetrical branching outlets with at least one outlet having larger internal dimensions than the other two, with Figure 5A being a radial cross-section through the branching outlets along line 5A-5A in a retracted position, with Figure 5B being an axial cross-section through the lines 5B-5B of Figure 5A, with Figure 5C being a radial cross-section along lines 5C-5C of Figure 5D with the branching outlets in an expanded position, and with Figure 5D being an axial cross-section along lines 5D-5D of Figure 5C with the branching outlets in an expanded position;

Figures 6A-6E illustrate radial cross-sections of several examples of branching outlet configurations of the branching sub according to the invention, with all outlet branches fully expanded from their retracted state during deployment in a parent well, with Figure 6A illustrating two equal diameter outlet branches, Figure 6B illustrating three equal diameter outlet branches, Figure 6C, like Figure 5C, illustrating three outlet branches with one branch characterized by a larger diameter than the other two, with Figure 6D illustrating four equal diameter outlet branches, and with Figure 6E illustrating five outlet branches with the center branch being of smaller diameter than the other four;

Figures 7A-7E illustrate stages of expanding the outlet members of an expandable branching sub according to the invention, with Figure 7A illustrating an axial cross-section of the sub showing multiple branching outlets with one such outlet in a retracted position and the other such outlet being expanded starting with its connection to the branching head and continuing expansion downwardly toward the

lower opening of the branching outlets, with Figure 7B illustrating a radial cross-section at axial position B of Figure 7A and assuming that each of three symmetrical branching outlets are being expanded simultaneously, and with Figures 7C through 7E showing various stages of expansion as a function of axial distance along the branching outlets; Figures 8A and 8B illustrate respectively in axial cross-section and a radial cross-section along lines 8B-8B, latching and orientation profiles of a branching chamber of the branching sub, and Figure 8A further illustrates an extension leg and supporting shoe for deployment in a parent well and for providing stability to the branching sub while expanding the branching outlets from their retracted position; Figure 9 schematically illustrates uphole and downhole apparatus for expanding the branching outlets of the branching sub;

Figure 10 illustrates steps of the process of expanding and forming the branching outlets with a pressure forming pad of the apparatus of Figure 9; Figures 11A-11H illustrate steps of an installation sequence for a nodal branching sub and for creating branch wells from a parent well according to the invention;

Figure 12 illustrates a branching sub deployed in a parent well and further illustrates branch well liners hung from branching outlets and still further illustrates production apparatus deployed in the branching sub for controlling production from branch wells into the parent well;

Figures 13A and 13B geometrically illustrate the increase in branch well size achievable for this invention as compared with prior art conventional axial branch wells from liners packed at the end of parent casing;

Figures 14A-14D are illustrative sketches of nodal branching according to the invention where Figure 14A illustrates establishing a node in a parent well and establishing branch wells at a common depth point in the parent well, all of which communicate with a parent well at the node of the parent well; with Figure 14B illustrating an expanded branching sub which has had its branching outlets expanded beyond the diameter of the parent casing and formed to be substantially round; with Figure 14C illustrating using a primary node and secondary nodes to produce hydrocarbons from a single strata; and with Figure 14D illustrating using an expanded branching sub from a primary node to reach multiple subterranean targets;

Figure 15A illustrates a two outlet version of a branching sub according to the invention, with Figures 15B, 15B', 15C, and 15D illustrating cross-sectional profiles of such two outlet version of a branching sub with an alternative post-forming tool at various depth locations in the outlet members;

Figure 16 illustrates a two arm alternative version

of a post-forming tool; and

Figures 17A-17D illustrate the operation of such alternative post-forming tool.

5 Description of the Preferred Embodiments

[0015] As described above, Figures 1A and 1B illustrate the problems with prior art apparatus and methods for establishing branch wells from a parent well. Figures 1A and 1B show radial and axial cross-sections of multiple outlet liners 12 hung and sealed from a large diameter conductor pipe 10. The outlets are round in order to facilitate use of conventional lining hanger packers 14 to seal the outlet liners 12 for communication with the conductor pipe 10. The arrangement of Figures 1A and 1B requires that multiple round outlets of diameter D_o fit within the diameter D_{s1} of the conductor pipe 10. In many cases, especially where the conductor pipe must be deployed at a depth in the well, rather than at the surface of the well, it is not feasible to provide a borehole of sufficient outer diameter to allow branch well outlets of sufficient diameter to be installed.

[0016] The technique of providing branch wells according to the prior art arrangement depicted in Figure 2 creates branch wells 22, 24 from a primary well 20. Special sealing arrangements 26, unlike conventional casing hangers, must be provided to seal a lined branch well 22, 24 to the primary well 20.

30 Description of Branching Sub According to the Invention

[0017] Figures 3A, 3B, and 3C illustrate a branching sub 30 according to the invention. The branching sub includes a branching chamber 32, (which may be connected to and carried by parent well casing (See parent casing 604 of Figure 12)), and multiple outlet members, for example three outlet members 34, 36, 38 illustrated in Figures 3A, 3B, and 3C. Figure 3A is a radial cross-section view through the branching chamber 32 which illustrates one outlet member 34 in a retracted state, a second outlet member 36 in the state of being expanded outwardly, and a third outlet member 38 which has been fully expanded outwardly. (Figure 3A is presented for illustrative purposes, because according to the invention it is preferred to expand and circularize each of the outlets simultaneously.) In the retracted state, each outlet is deformed as shown particularly for outlet member 34. A round tube is deformed such that its cross-sectional interior area remains essentially the same as that of a circular or round tube, but its exterior shape is such that it fits cooperatively with the deformed shape of the other outlet members, all within an imaginary cylinder having a diameter essentially the same as that of the branching chamber 32. In that way the branching chamber 32 and its retracted outlet members have an effective outer diameter which allows it to be run in a parent well to a deployment location while attached to a parent casing. Outlet member 34 in its retracted state is illustrated in

an oblong shape, but other retracted shapes may also prove to have advantageous characteristics. For example, a concave central area of deformation in the outer side of a retracted outlet member may be advantageous to provide a stiffer outlet member. Such deformation is progressively greater and deeper starting from the top to the bottom of the outlet member.

[0018] Figure 3A shows outlet member 36 in a state of being expanded in an arcuate path outwardly from the branching chamber 32 while simultaneously being rounded by a downhole forming-expanding tool that is described below. The arrows labeled F represent forces being applied from the interior of the outlet member 36 in order to expand that outlet member both outwardly in an arcuate path away from branching chamber 32 and to circularize it from its retracted state (as is the condition of outlet member 34) to its expanded or fully deployed state like outlet member 38.

[0019] Figure 3B is a radial cross-section as viewed by lines B-B of Figure 3C through the branching sub 30 at the level of outlet members 36, 38. Figure 3C illustrates conventional casing liners 42, 44 which have been installed through branching chamber 32 and into respective outlet members 36, 38. Conventional liner hanging packers 46, 48 seal casing liners 42, 44 to outlet members 36, 38. As illustrated in Figures 3B and 3C, if the diameter D_{s2} of the branching chamber 32 is the same as the diameter D_{s1} of the conductor pipe of prior art Figure 1B, then the outlet diameter D_c of Figure 3C is 1.35 times as great as the outer diameter D_o of Figure 1B. The liner cross-sectional area S_c of the sub of Figure 3C is 1.82 times as great as the liner cross-sectional area S_o of Figure 1A. When fully expanded, the effective diameter of the expanded outlet members 34, 36, 38 exceeds that of the branching chamber 32.

[0020] Figure 4 is a perspective view of the branching sub 30 of Figures 3A, 3B, 3C where the branching sub is shown after expansion. Threads 31 are provided at the top end of branching chamber 32. Threads 31 enable branching sub 30 to be connected to a parent casing for deployment at a subterranean location. Outlet members 34, 36, 38 are shown expanded as they would look downhole at the end of a parent well.

[0021] Figures 5A-5D illustrate an alternative three outlet branching sub 301 according to the invention. Figures 5A and 5B illustrate in radial and axial cross-section views the sub 301 in its retracted position. Outlet members 341, 361 and 381 are illustrated with outlet member 361 being about equal to the combined radial cross-sectional area of outlet members 341 and 381 combined. Each of the outlet members are deformed inwardly from a round tubular shape to the shapes as illustrated in Figure 5A whereby the combined deformed areas of outlet members 341, 361 and 381 substantially fill the circular area of branching chamber 321. Other deformation shapes may be advantageous as mentioned above. Each deformed shape of outlet members 341, 361 and 381 of Figure 5A is characterized by (for example, of the

outlet member 341) a circular outer section 342 and one or more connecting, non-circular sections 343, 345. Such non-circular sections 343, 345 are cooperatively shaped with section 362 of outlet member 361 and 382 of outlet member 381 so as to maximize the internal radial cross-sectional areas of outlet members 341, 361 and 381.

[0022] Figures 5C and 5D illustrate the branching sub 301 of Figures 5A and 5B after its outlet members have been fully expanded after deployment in a parent well. Outlet members 361 and 381 are illustrated as having been simultaneously expanded in a gently curving path outwardly from the axis of branching chamber 321 and expanded radially to form circular tubular shapes from the deformed retracted state of Figures 5A and 5B.

[0023] Figures 6A-6E show in schematic form the size of expanded outlet members as compared to that of the branching chamber. Figure 6A shows two outlet members 241, 242 which have been expanded from a deformed retracted state. The diameters of outlet members 241 and 242 are substantially greater in an expanded state as compared to their circular diameters if they could not be expanded. Figure 6B repeats the case of Figure 3B. Figure 6C repeats the uneven triple outlet configuration as shown in Figures 5A-5D. Figure 6D illustrates four expandable outlet members from a branching chamber 422. Each of the outlet members 441, 442, 443, 445 are of the same diameter. Figure 6E illustrates five outlet members, where outlet member 545 is smaller than the other four outlet members 541, 542, 543, 544. Outlet member 545 may or may not be deformed in the retracted state of the branching sub.

Description of Method for Expanding a Deformed Retracted Outlet Member

[0024] Figures 7A-7E illustrate downhole forming heads 122, 124, 126 operating at various depths in outlet members 38, 34, 36. As shown on the right hand side of Figure 7A, a generalized forming head 122 is shown as it enters a deformed retracted outlet member, for example outlet member 38, at location B. Each of the forming heads 122, 124, 126 has not yet reached an outlet member, but the heads have already begun to expand the outlet wall of branching chamber 32 outwardly as illustrated in Figure 7B. The forming heads 122, 124, 126 continue to expand the outlet members outwardly as shown at location C. Figure 7C shows the forming heads 122, 124, 126 expanding the outlet members outwardly while simultaneously circularizing them. Forming pads 123, 125, 127 are forced outwardly by a piston in each of the forming heads 122, 124, 126. The forming heads simultaneously bear against central wall region 150 which acts as a reaction body so as to simultaneously expand and form the outlet members 38, 34, 36 while balancing reactive forces while expanding. Figures 7D and 7E illustrate the forming step locations D and E of Figure 7A.

[0025] Figures 8A and 8B illustrate an axially extending slot 160 in the branching chamber 32 of branching sub 30. Such slot 160 cooperates with an orienting and latching sub of a downhole forming tool for radial positioning of such orienting and latching sub for forming and expanding the multiple outlet members downhole. A notch 162 in branching chamber 32 is used to latch the downhole forming tool at a predetermined axial position.

[0026] An extension leg 170 projects downwardly from the central wall region 150 of branching sub 30. A foot 172 is carried at the end of extension leg 170. In operation, foot 172 is lowered to the bottom of the borehole at the deployment location. It provides support to branching sub 30 during forming tool expanding and other operations.

Description of Forming Tool

a) Description of Embodiment of Figures 9, 10

[0027] Figures 9 and 10 illustrate the forming tool used to expand multiple outlet members, for example outlet members 34, 36, 38 of Figures 3A, 3B, and 3C and Figures 7B, 7C, 7D and 7E. The forming tool includes uphole apparatus 100 and downhole apparatus 200. The uphole apparatus 100 includes a conventional computer 102 programmed to control telemetry and power supply unit 104 and to receive commands from and display information to a human operator. An uphole winch unit 106 has an electrical wireline 110 spooled thereon for lowering downhole apparatus 200 through a parent well casing and into the branching chamber 32 of a branching sub 30 which is connected to and carried at the end of the parent casing.

[0028] The downhole apparatus 200 includes a conventional cable head 202 which provides a strength/electrical connection to wireline 110. A telemetry, power supplies and controls module 204 includes conventional telemetry, power supply and control circuits which function to communicate with uphole computer 102 via wireline 110 and to provide power and control signals to downhole modules. Hydraulic power unit 206 includes a conventional electrically powered hydraulic pump for producing downhole pressurized hydraulic fluid. An orienting and latching sub 208 includes a latching device 210 (schematically illustrated) for fitting within notch 162 of branching chamber 32 of Figure 8A and an orienting device 212 (schematically illustrated) for cooperating with slot 160 of branching chamber 32. When the downhole apparatus 200 is lowered into branching sub 30, orienting device 212 enters the slot 160 and the downhole apparatus 200 is further lowered until the latching device 210 enters and latches within notch 162.

[0029] Fixed traveling head 213 provides hydraulic fluid communication between hydraulic power unit 206 and the traveling forming heads 122, 124, 126, for example. Telescopic links 180 provide pressurized hydraulic fluid to traveling forming heads 122, 124, 126 as

the heads 122, 124, 126 move downwardly within the multiple outlet members, for example outlet members 34, 36, 38 of Figures 7B-7E. Monitoring heads 182, 184, 186 are provided to determine the radial distance moved while radially forming an outlet member.

[0030] Figure 10 illustrates traveling forming heads 126, 124, 122 in different stages of forming an outlet member of branching sub 30. Forming head 126 is shown in outlet member 36, which is illustrated by a heavy line before radial forming in the retracted outlet member 36. The outlet member is shown in light lines 36', 36". Where the outlet member is depicted as 36' in an intermediate stage of forming and as 36" in its final formed stage.

[0031] The forming head 124 is shown as it is radially forming retracted outlet member 34 (in light line) to an intermediate stage 34'. A final stage is illustrated as circularized outlet member 34". The forming head 124, like the other two forming heads 126, 122, includes a piston 151 on which forming pad 125 is mounted. Piston 151 is forced outwardly by hydraulic fluid applied to opening hydraulic line 152 and is forced inwardly by hydraulic fluid applied to closing hydraulic line 154. A caliper sensor 184 is provided to determine the amount of radial travel of piston 151 and forming pad 125, for example. Suitable seals are provided between the piston 151 and the forming head 124.

[0032] The forming head 122 and forming pad 123 are illustrated in Figure 10 to indicate that under certain circumstances the shape of the outlet member 38 may be over expanded to create a slightly oblong shaped outlet, such that when radial forming force from forming pad 123 and forming head 122 is removed, the outlet will spring back into a circular shape due to residual elasticity of the steel outlet member.

[0033] At the level of the branching chamber 32, forming heads 122, 124, 126, balance each other against the reaction forces while forcing the walls of the chamber outwardly. Accordingly the forming heads 122, 124, 126 are operated simultaneously, for example at level B of Figure 7A, while forcing the lower end of the wall of the branching chamber 32 outwardly. When a forming head 122 enters an outlet member 38 for example, the pad reaction forces are evenly supported by the central wall region 150 of the branching chamber 32. The telescopic links 180 may be rotated a small amount so that the forming pads 127, 125, 123 can apply pressure to the right or left from the normal axis and thereby improve the roundness or circularity of the outlet members. After a forming sequence is performed, for example at location D in Figure 7A, the pressure is released from piston 151, and the telescopic links 180 lower the forming heads 122, for example, down by one step. Then the pressure is raised again for forming the outlet members and so forth.

[0034] The composition of the materials of which the branching sub 30 is constructed is preferably of an alloy steel with austenitic structure, such as manganese

steel, or nickel alloys such as "Monel" and "Inconel" series. Such materials provide substantial plastic deformation with cold forming thereby providing strengthening.

b) Description of Alternative Embodiment of Figures 15A-15D, 16 and 17A-17D

[0035] An alternative post-forming tool is illustrated in Figures 15A, 15B, 15B', 15C, 15D, 16, and 17A-17D. The post-forming tool 1500 is supported by common downhole components of Figure 9 including a cable head 202, telemetry, power supplies and controls module 204, hydraulic power unit 206 and an orienting and latching sub 208. Figure 16 illustrates that post-forming tool 1500 includes a travel actuator 1510. A piston 1512 of travel actuator 1510 moves from an upper retracted position as shown in Figure 17A to a lower extended position as shown in Figures 17C and 17D. Figure 17B shows the piston 1512 in an intermediate position. Piston 1512 moves to intermediate positions depending on the desired travel positions of forming heads in the outlet members.

[0036] Figures 16 and 17D illustrate a two forming head embodiment of the post-forming tool 1500 where two outlet members (e.g., see outlet members 1560 and 1562 of Figures 15A-15D) are illustrated. Three or more outlet members may be provided with a corresponding number of forming heads and actuators provided. Links 1514 connect the piston 1512 to actuator cylinders 1516. Accordingly, actuator cylinders 1516 are forced downwardly into outlet members 1560, 1562 as piston 1512 moves downwardly.

[0037] Actuator cylinders 1516 each include a hydraulically driven piston 1518 which receives pressurized hydraulic fluid from hydraulic power unit 206 (Figure 9) via travel actuator 1510 and links 1514. The piston 1518 is in an upper position as illustrated in Figures 17A and 17C and in a lower position as illustrated in Figures 17B and 17D.

[0038] The actuator cylinders 1516 are pivotally linked via links 1524 to forming pads 1520. The pistons 1518 are linked via rods 1526 to expanding rollers 1522. As shown in Figures 17A and 15B', the forming pads 1520 enter an opening of two retracted outlet members as illustrated in Figure 15B. The expanding rollers 1522 and forming pads 1520 are in a retracted position within retracted outlet members 1560, 1562.

[0039] The piston 1512 is stroked downwardly a small amount to move actuator cylinders 1516 downwardly a small amount. Next, pistons 1518 are stroked downwardly causing expanding rollers 1522 to move along the inclined interior face of forming pads 1520 causing the pads to push outwardly against the interior walls of retracted outlet members 1560, 1562 until the outlet members achieve a circular shape at that level. Simultaneously, the outlet members are forced outwardly from the axis of the multiple outlet sub 1550. Next, the pistons 1518 are stroked upwardly, thereby returning

the expanding rollers 1522 to the positions as shown in Figure 15C. The piston 1512 is stroked another small distance downwardly thereby moving the forming pads 1520 further down into the outlet members 1560, 1562. Again, the pistons 1518 are stroked downwardly to further expand the outlet members 1560, 1562 outwardly and to circularize the outlets. The process is continued until the positions of Figures 15D and 17D are reached which illustrate the position of the forming pads 1520 and actuator cylinders 1516 at the distal end of the multiple outlet members 1560, 1562.

Description of Method for Providing Branch Wells

[0040] Figures 11A-11H and Figure 12 describe the process for establishing branch wells from a branching sub 30 in a well. The branching sub 30 is illustrated as having three outlet members 34, 36, 38 (per the example of Figures 3A, 3B, 3C and Figures 7A-7E) but any number of outlets may also be used as illustrated in Figures 6A-6E. Only the outlets 38, 36 are illustrated from the axial cross-sectional views presented, but of course a third outlet 34 exists for a three outlet example, but it is not visible in the views of Figures 11A-11H or Figure 12.

[0041] Figure 11A shows that the branching sub 30 is first connected to the lower end of a parent casing 604 which is conveyed through intermediate casing 602 (if present). Intermediate casing 602 lines the wellbore and is typically run through surface casing 600. Surface casing 600 and intermediate casing 602 are typically provided to line the wellbore. The parent casing 604 may be hung from intermediate casing 602 or from the wellhead at the surface of the earth or on a production platform.

[0042] The outlet members 36, 38 (34 not shown) are in the retracted position. Slot 160 and notch 162 are provided in branching chamber 32 of branching sub 30 (see Figure 12) to cooperate with orienting device 212 and latching device 210 of orienting and latching sub 208 of downhole apparatus 200 (See Figure 9). When the parent casing 604 is set downhole, the branching sub 30 may be oriented by rotating the parent casing 604 or by rotating only the branching sub 30 where a swivel joint is installed (not illustrated) at the connection of the branching sub 30 with the parent well casing 604. The orienting process may be monitored and controlled by gyroscopic or inclinometer survey methods.

[0043] Figure 11B illustrates the forming step described above with forming heads 122, 126 shown forming outlet members 38, 36 with hydraulic fluid being provided by telescopic links 180 from hydraulic power unit 206 and fixed traveling head 213. The outlet members 36, 38 are rounded to maximize the diameter of the branch wells and to cooperate by fitting with liner hangers or packers in the steps described below. The forming step of Figure 11B also strengthens the outlet members 36, 38 by their being cold formed. As described above,

the preferred material of the outlet members 36, 38 of the branching sub is alloyed steel with an austenitic structure, such as manganese steel, which provides substantial plastic deformation combined with high strengthening. Cold forming (plastic deformation) of a nickel alloy steel, such as "Inconel", thus increases the yield strength of the base material at the bottom end of the branching chamber 32 and in the outlet members 36, 38. The outlet members are formed into a final substantially circular radial cross-section by plastic deformation.

[0044] As described above, it is preferred under most conditions to convey and control the downhole forming apparatus 200 by means of wireline 110, but under certain conditions, e.g., under-balanced wellbore conditions, (or in a highly deviated or horizontal well) a coiled tubing equipped with a wireline may replace the wireline alone. As illustrated in Figure 11B and described above, the downhole forming apparatus 200 is oriented, set and locked into the branching sub 30. Latching device 210 snaps into notch 162 as shown in Figure 11B (see also Figure 12). Hydraulic pressure generated by hydraulic power unit 206 is applied to pistons in forming heads 122, 126 that are supported by telescopic links 180. After a forming sequence has been performed, the pressure is released from the pistons, and the telescopic links 180 lower the forming pads down by one step. Then the pressure is raised again and so on until the forming step is completed with the outlet members circularized. After the outlet members are expanded, the downhole forming apparatus 200 is removed from the parent casing 604.

[0045] Figures 11C and 11D illustrate the cementing steps for connecting the parent casing 604 and the branching sub 30 into the well. Plugs or packers 800 are installed into the outlet members 36, 38. The preferred way to set the packers 800 is with a multiple head stinger 802 conveyed either by cementing string 804 or a coiled tubing (not illustrated). A multiple head stinger includes multiple heads each equipped with a cementing flow shoe. The stinger 802 is latched and oriented in the branching chamber 32 of branching sub 30 in a manner similar to that described above with respect to Figure 11B. As illustrated in Figure 11D, cement 900 is injected via the cementing string 804 into the packers 800, and after inflating the packers 800 flows through conventional check valves (not shown) into the annulus outside parent casing 604, including the bottom branching section 1000. Next, the cementing string 804 is pulled out of the hole after disconnecting and leaving packers 800 in place as shown in Figure 11E.

[0046] As shown in Figure 11F, individual branch wells (e.g. 802) are selectively drilled using any suitable drilling technique. After a branch well has been drilled, a liner 805 is installed, connected, and sealed in the outlet member, 36 for example, with a conventional casing hanger 806 at the outlet of the branching sub 30 (See Figures 11G and 11H). The liner may be cemented (as

illustrated in Figure 11G) or it may be retrievable depending on the production or injection parameters, and a second branch well 808 may be drilled as illustrated in Figure 11H.

[0047] Figure 12 illustrates completion of branch wells from a branching sub at a node of a parent well having parent casing 604 run through intermediate casing 602 and surface casing 600 from wellhead 610. As mentioned above, parent casing 604 may be hung from intermediate casing 602 rather than from wellhead 610 as illustrated. The preferred method of completing the well is to connect the branch wells 802, 808 to a downhole manifold 612 set in the branching chamber 32 above the junction of the branch wells 802, 808. The downhole manifold 612 is oriented and latched in branching chamber 32 in a manner similar to that of the downhole forming tool as illustrated in Figures 8A, 8B and 11B. The downhole manifold 612 allows for control of the production of each respective branch well and provides for selective re-entry of the branch wells 802, 808 with testing or maintenance equipment which may be conveyed through production tubing 820 from the surface.

[0048] In case of remedial work in the parent casing 604, the downhole manifold 612 can isolate the parent well from the branch wells 802, 808 by plugging the outlet of the downhole manifold 612. This is done by conveying a packer through production tubing 820, and setting it in the outlet of downhole manifold 612 before disconnecting and removing the production tubing 820. Valves controllable from the surface and testing equipment can also be placed in the downhole equipment. The downhole manifold 612 can also be connected to multiple completion tubing such that each branch well 802, 808 can be independently connected to the surface wellhead.

[0049] The use of a branching sub for branch well formation, as described above, for a triple branch well configuration, allows the use of dramatically smaller parent casing as compared to that required in the prior art arrangement of Figures 1A and 1B. The relationships between the branching sub diameter D_s , the maximum expanded outlet diameter D_o , and the maximum diameter of a conventional axial branch D_c for a two outlet case is shown in Figure 13A, and for a three outlet case in Figure 13B. The same kind of analysis applies for other multiple outlet arrangements. In comparison to an equivalent axial branching that could be made of liners packed at the end of the parent casing, the branching well methods and apparatus of the present invention allow a gain in branch cross-sectional area ranging from 20 to 80 percent.

[0050] Figures 14A-14D illustrate various uses of two node branch well configurations according to the invention. Figures 14A and 14B illustrate a branching sub at a node according to the invention. Figure 14C illustrates how branch wells may be used to drain a single strata or reservoir 1100, while Figure 14D illustrates the use of a single node by which multiple branch wells are di-

rected to different target zones 1120, 1140, 1160. Any branch well may be treated as a single well for any intervention, plugging, or abandonment, separate from the other wells.

[0051] Various modifications and alterations in the described methods and apparatus will be apparent to those skilled in the art of the foregoing description which do not depart from the spirit of the invention. For this reason, such changes are desired to be included within the scope of the appended claims which include the only limitations to the present invention. The descriptive manner which is employed for setting forth the embodiments should be interpreted as illustrative but not limited.

Claims

1. An apparatus for casing a borehole, said apparatus comprising:

a string of well casing (604); and
a multiple branching sub (30) on the lowermost end of said well casing string (604), wherein said multiple branching sub (30) includes a branching chamber (32) having an open first end of cylindrical shape and a second end, said branching chamber (32) in sealed connection at said first end with said well casing (604); and multiple branching outlet members (34, 36, 38), each of which is integrally connected to said second end of said branching chamber (32), each of said multiple branching outlet members (34, 36, 38) being in fluid communication with said branching chamber (32), said sub (30) being **characterized by**:

a retracted position for insertion into said borehole in which each of said multiple branching outlet members (34, 36, 38) is substantially totally within an imaginary cylinder which is coaxial with and of substantially the same radius as said first end of said branching chamber (32); and
an expanded position in which at least one of said multiple branching outlet members (34, 36, 38) extends from said branching chamber (32) in a path outwardly of said imaginary cylinder.

2. The apparatus of claim 1, wherein said multiple branching outlet members (34, 36, 38) are designed and arranged such that in said expanded position, each of said multiple outlet members (34, 36, 38) extends in an arcuate path from said branching chamber (32) outwardly of said imaginary cylinder.

3. The apparatus of claim 1 or claim 2, wherein:

said at least one of said multiple branching outlet members (34, 36, 38) in said retracted position is **characterized by** a radial non-circular cross-sectional shape; and
said at least one of said multiple branching outlet members (34, 36, 38) in said expanded position is **characterized by** a substantially circular radial cross-sectional shape.

4. The apparatus of claim 1 or claim 2 wherein:

each one of said multiple branching outlet members (34, 36, 38) in said retracted position is **characterized by** a non-circular radial cross-sectional shape; and
at least one of said multiple branching outlet members (34, 36, 38) in said expanded position is **characterized by** a substantially circular radial cross-sectional shape.

5. The apparatus of any preceding claim, wherein:

said multiple branching outlet members (34, 36, 38) are formed of a material which may be plastically deformed by cold forming.

6. The apparatus of claim 5 wherein said material is an alloyed steel with austenitic structure.

7. The apparatus of claim 6 wherein said material is a nickel alloy.

8. The apparatus of any preceding claim, wherein each of said multiple branching outlet members (34, 36, 38) is of substantially the same radial cross-sectional area.

9. The apparatus of any preceding claim, wherein at least one of said multiple branching outlet members (34, 36, 38) is **characterized by** a radial cross-sectional area which is greater than at least one other of said multiple branching outlet members (34, 36, 38).

10. The apparatus of any preceding claim, wherein said multiple branching outlet members include five outlets (541, 542, 543, 544, 545), where one of said outlets (545) is **characterized by** a radial cross-sectional area which is less than four (541, 542, 543, 544) of said multiple branching outlet members.

11. The apparatus of any preceding claim, further comprising:

a leg member (170) carried substantially axially

downwardly from said second end of said branching chamber (32); and
a foot (172) disposed at a distal end of said leg (170).

12. The apparatus of any one of claims 1 to 10 wherein:

a central support region (150) is defined at said second end of said branching chamber (32) between integral connections of said multiple branching outlet members (34, 36, 38) to said second end, and further comprising:

an extension leg (170) carried from said central support region (150) which extends axially beyond said multiple branching outlet members (34, 36, 38); and
a foot (172) disposed at a distal end of said leg (170).

13. A method of installing a multiple branching sub (30) in a borehole where said sub (30) includes a branching chamber (32) having a cylindrical first end and a second end, and multiple branching outlet members (34, 36, 38) each of which is connected to said second end of said branching chamber (32) and which are disposed in a retracted position in which each of said multiple branching outlet members (34, 36, 38) is substantially totally within an imaginary cylinder which is coaxial with, and of substantially the same radius as, said cylindrical first end of said branching chamber (32), the method comprising the steps of:

connecting said first end of said branching chamber (32) of said sub (30) to a lower end of a casing string (604);

running said casing string (604) and said sub (30) into a borehole to a node position where a branch borehole (801) is to be provided;

running a forming tool (200) through said casing string (604) into said branching chamber (32) of said sub (30);

orienting said forming tool (200) within said sub (30) in order to insert said forming tool (200) into at least one of said multiple branching outlet members (34, 36, 38) at said second end of said branching chamber (32); and

expanding said at least one of said multiple branching outlet members (34, 36, 38) with said forming tool (200) until said at least one multiple branching outlet member extends from a connection at said second end of said branching chamber (32) in a path outwardly of said imaginary cylinder.

14. In the method of claim 13 in which said at least one of said multiple branching outlet members (34, 36,

38) in said retracted position is **characterized by** a non-circular radial cross-sectional shape, said expanding step including the substep of expanding said at least one of said multiple branching outlet members (34, 36, 38) with said forming tool (200) until said at least one multiple branching outlet member is **characterized by** a substantially circular radial cross-sectional shape.

15. The method of claim 14, wherein the expanding step includes the further substeps of expanding a plurality of multiple branching outlet members (34, 36, 38) with said forming tool (200) until each one of said plurality of multiple branching outlet members (34, 36, 38) is **characterized by** a substantially circular radial cross-sectional shape and each one of said plurality of multiple branching outlet members (34, 36, 38) extends from a connection at said second end of said branching chamber (32) in a path outwardly of said imaginary cylinder.

16. The method of claim 15, wherein said substeps of expanding a plurality of multiple branching outlet members (34, 36, 38) with said forming tool (200) are performed simultaneously.

17. The method of claim 13, wherein said expanding step includes a plurality of sub expanding steps, with the first sub expanding step beginning at the connection of said at least one of said multiple branching outlet members (34, 36, 38) at said branching chamber (32) and with multiple additional sub expanding steps performed at respectively greater distances from said connection of said at least one of said multiple branching outlet members (34, 36, 38) at said branching chamber (32).

18. A multiple branching sub (30) with an apparatus (100, 200) for expanding and forming an outlet (34, 36, 38) of said multiple branching sub (30) in a cased borehole, where said sub (30) includes a branching chamber (32) having a first end, a second end, and multiple branching outlet members (34, 36, 38) each of which is connected to said second end of said branching chamber (32), with said branching outlet members (34, 36, 38) being in a retracted condition in which each of said outlet members (34, 36, 38) is substantially totally within an imaginary cylinder which is coaxial with and substantially the same radius as said first end of said branching chamber (32), said apparatus (100, 200) including:

an uphole power and control unit (100);
a downhole operational unit (200); and
an electrical wireline (110) connected between said uphole power and control unit (100) and said downhole operational unit (200) for provid-

- ing a path for electrical power and electrical communication signals therebetween; said downhole operational unit (200) including a forming mechanism (122, 124, 126) arranged and designed for insertion in a retracted branching outlet member (34, 36, 38) of said sub (30) for expanding at least one of said multiple outlet members (34, 36, 38) so that it extends in a path from said branching chamber (32) outwardly of said imaginary cylinder.
19. The sub (30) and apparatus (100, 200) of claim 18, wherein said downhole operational unit (200) includes:
- means (210) for latching said downhole operational unit (200) at a predetermined axial position within said multiple branching sub (30); and means (212) for radially orienting said forming mechanism (122, 124, 126) such that said forming mechanism (122, 124, 126) is aligned with a selected branching outlet member (34, 36, 38) of said sub (30).
20. The sub (30) and apparatus (100, 200) of claim 19, wherein said downhole operational unit (200) further includes:
- a hydraulic pump (206) for pressurizing hydraulic fluid; and
a head (213) having hydraulic fluid lines connected to said hydraulic pump (206); and
- wherein
said forming mechanism (122, 124, 126) includes a hydraulically powered forming pad (123, 125, 127) and a link (152) between said forming pad (123, 125, 127) and said head (213) for providing pressurized hydraulic fluid to said forming pad (123, 125, 127).
21. The sub (30) and apparatus (100, 200) of claim 20, wherein said forming mechanism (122, 124, 126) includes a piston (151) for forcing said forming pad (123, 125, 127) outwardly against said outlet member (34, 36, 38).
22. The sub (30) and apparatus (100, 200) of claim 20, wherein said forming pad (1520) includes an inclined interior surface and said forming mechanism (1500) includes rollers (1522) coupled to said link (1526) for cooperating with said inclined interior surface to force said forming pad (1520) outwardly against said outlet member (1560, 1562).
23. The sub (30) and apparatus (100, 200) of claim 22, further including an expanding actuator having a cylinder body (1516) coupled to said forming pad (1520) by means of a pivotal link (1524) and having a piston (1518) coupled to said rollers (1522) by means of a rod (1526).
24. The sub (30) and apparatus (100, 200) of claim 23, further including a travel actuator (1510) including a piston (1512) which is linked structurally and hydraulically to said cylinder body (1516) of said expanding actuator.
25. A method of forming a branch well (801) from a parent well comprising:
- running a branching sub (30) having a branching chamber (32) and multiple branching outlets (34, 36, 38) with a parent casing (604) through a parent well to a branching location; orienting said branching sub (30) until its multiple branching outlets (34, 36, 38) are disposed in a predetermined orientation; and
expanding and forming at least one of said multiple branching outlets (34, 36, 38) until it extends in a path beyond the diameter of said branching chamber (32) and achieves a substantially round shape.
26. The method of claim 25, wherein said expanding and forming step is performed upon a plurality of multiple branching outlets (34, 36, 38) until each one of said plurality of multiple branching outlets (34, 36, 38) extends in a path beyond said diameter of said branching chamber (32).
27. The method of claim 26, further comprising the steps of:
- plugging each of said multiple branching outlets (34, 36, 38);
forming a branch borehole (801) through a selected one (36) of said multiple branching outlets (34, 36, 38);
installing a substantially round liner (805) in said branch borehole (801); and
sealing an end of said substantially round liner (805) to said substantially round end of said selected one (36) of said multiple branching outlets (34, 36, 38).
28. The method of claim 27, wherein said sealing of said end of said liner (805) with respect to said selected one (36) of said multiple branching outlets (34, 36, 38) is by means of a liner hanger packer (806).
29. The method of claim 27, further comprising the steps of:
- forming a branch borehole (801, 808) through

a plurality of said multiple branching outlets (36, 38);
 installing a substantially round liner (805, 810) in each of said plurality of multiple branching outlets (36, 38); and
 sealing an end of each of said substantially round liners (805, 810) to a respective end of one of said plurality of said multiple branching outlets (36, 38).

30. The method of claim 29, further comprising the steps of:

installing a downhole manifold (612) in said branching chamber (32);
 completing each branch borehole (801, 808); and
 controlling the production of each branch borehole (801, 808) to said parent well with said manifold (612).

31. The method of claim 27, further comprising the step of delaying forming a branch borehole (808) through at least one of said multiple branching outlets and thereby reserving a branch outlet for future well development.

32. The method of claim 29, further comprising the steps of:

injecting a heated fluid into at least one of said branch boreholes (801, 808) for the purpose of reservoir flow enhancement; and
 producing hydrocarbon fluid from another of said multiple branch boreholes (801, 808) from a reservoir into which heated fluid has been injected.

Patentansprüche

1. Vorrichtung zum Auskleiden eines Bohrlochs, wobei die Vorrichtung umfaßt:

einen Strang aus Bohrlochauskleidungen (604); und
 eine mehrfach verzweigende Unterbaueinheit (30) am untersten Ende des Bohrlochauskleidungsstrangs (604), wobei die mehrfach verzweigende Unterbaueinheit (30) enthält:

eine Verzweigungskammer (32) mit einem oberen ersten Ende mit zylindrischer Form und einem zweiten Ende, wobei die Verzweigungskammer (32) am ersten Ende mit der Bohrlochauskleidung (604) dicht verbunden ist; und
 mehrere verzweigende Auslaßelemente

(34, 36, 38), wovon jedes mit dem zweiten Ende der Verzweigungskammer (32) einteilig verbunden ist und mit der Verzweigungskammer (32) in einer Fluidverbindung steht, wobei die Unterbaueinheit (30) gekennzeichnet ist durch:

eine eingefahrene Position für die Einführung in das Bohrloch, in der sich jedes der mehrfach verzweigenden Auslaßelemente (34, 36, 38) im wesentlichen vollständig innerhalb eines imaginären Zylinders befindet, der zu dem ersten Ende der Verzweigungskammer (32) koaxial ist und im wesentlichen den gleichen Radius wie dieses besitzt; und

eine ausgefahrene Position, in der sich wenigstens eines der mehreren verzweigenden Auslaßelemente (34, 36, 38) von der Verzweigungskammer (32) längs eines aus dem imaginären Zylinder verlaufenden Weges erstreckt.

2. Vorrichtung nach Anspruch 1, bei der die mehreren verzweigenden Auslaßelemente (34, 36, 38) so entworfen und beschaffen sind, daß sich in der ausgefahrenen Position jedes der mehreren Auslaßelemente (34, 36, 38) auf einem gekrümmten Weg von der Verzweigungskammer (32) aus dem imaginären Zylinder erstreckt.

3. Vorrichtung nach Anspruch 1 oder 2, bei der:

das wenigstens eine der mehreren verzweigenden Auslaßelemente (34, 36, 38) in der eingefahrenen Position gekennzeichnet ist durch eine nicht kreisförmige radiale Querschnittsform; und
 das wenigstens eine der mehreren verzweigenden Auslaßelemente (34, 36, 38) in der ausgefahrenen Position gekennzeichnet ist durch eine im wesentlichen kreisförmige radiale Querschnittsform.

4. Vorrichtung nach Anspruch 1 oder Anspruch 2, bei der:

jedes der mehreren verzweigenden Auslaßelemente (34, 36, 38) in der eingefahrenen Position gekennzeichnet ist durch eine nicht kreisförmige radiale Querschnittsform; und
 wenigstens eines der mehreren verzweigenden Auslaßelemente (34, 36, 38) in der ausgefahrenen Position gekennzeichnet ist durch eine im wesentlichen kreisförmige radiale Querschnittsform.

5. Vorrichtung nach einem vorhergehenden Anspruch, bei der:

die mehreren verzweigenden Auslaßelemente (34, 36, 38) aus einem Werkstoff gebildet sind, der durch Kaltformung plastisch geformt werden kann.

6. Vorrichtung nach Anspruch 5, bei der der Werkstoff ein legierter Stahl mit Austenitstruktur ist.

7. Vorrichtung nach Anspruch 6, bei der der Werkstoff eine Nickellegierung ist.

8. Vorrichtung nach einem vorhergehenden Anspruch, bei der jedes der mehreren verzweigenden Auslaßelemente (34, 36, 38) im wesentlichen die gleiche radiale Querschnittsfläche besitzt.

9. Vorrichtung nach einem vorhergehenden Anspruch, bei der

wenigstens eines der mehreren verzweigenden Auslaßelemente (34, 36, 38) **gekennzeichnet ist durch** eine radiale Querschnittsfläche, die größer als diejenige wenigstens eines der weiteren der mehreren verzweigenden Auslaßelemente (34, 36, 38) ist.

10. Vorrichtung nach einem vorhergehenden Anspruch, bei der die mehreren verzweigenden Auslaßelemente fünf Auslässe (541, 542, 543, 544, 545) umfassen, wobei einer der Auslässe (545) **gekennzeichnet ist durch** eine radiale Querschnittsfläche, die größer ist als diejenige von vier (541, 542, 543, 544) der mehreren verzweigenden Auslaßelemente.

11. Vorrichtung nach einem vorhergehenden Anspruch, die ferner umfaßt:

ein Beinelement (170), das vom zweiten Ende der Verzweigungskammer (32) mit einer im wesentlichen axial abwärts weisenden Orientierung getragen wird; und einen Fuß (172), der an einem distalen Ende des Beins (170) angeordnet ist.

12. Vorrichtung nach einem der Ansprüche 1 bis 10, bei der:

ein zentraler Trägerbereich (150) am zweiten Ende der Verzweigungskammer (32) zwischen einteiligen Verbindungen der mehreren verzweigenden Auslaßelemente (34, 36, 38) mit dem zweiten Ende definiert ist, und die ferner umfaßt:

ein Verlängerungsbein (170), das vom

zentralen Trägerbereich (150) getragen wird und sich axial über die mehreren verzweigenden Auslaßelemente (34, 36, 38) hinaus erstreckt; und einen Fuß (172), der an einem distalen Ende des Schenkels (170) angeordnet ist.

13. Verfahren zum Installieren einer mehrfach verzweigenden Unterbaueinheit (30) in einem Bohrloch, wobei die Unterbaueinheit (30) eine Verzweigungskammer (32) mit einem zylindrischen ersten Ende und einem zweiten Ende sowie mehrere verzweigende Auslaßelemente (34, 36, 38) besitzt, wovon jedes mit dem zweiten Ende der Verzweigungskammer (32) verbunden ist und die in einer eingefahrenen Position angeordnet sind, in der sich jedes der mehreren verzweigenden Auslaßelemente (34, 36, 38) im wesentlichen vollständig innerhalb eines imaginären Zylinders befindet, der zu dem zylindrischen ersten Ende der Verzweigungskammer (32) koaxial ist und im wesentlichen den gleichen Durchmesser wie dieser besitzt, wobei das Verfahren die folgenden Schritte umfaßt:

Verbinden des ersten Endes der Verzweigungskammer (32) der Unterbaueinheit (30) mit einem unteren Ende eines Auskleidungsstrangs (604);

Bewegen des Auskleidungsstrangs (604) und der Unterbaueinheit (30) in ein Bohrloch zu einer Knotenposition, an der ein Verzweigungsbohrloch (801) vorgesehen werden soll;

Bewegen eines Formungswerkzeugs (200) durch den Auskleidungsstrang (604) in die Verzweigungskammer (32) der Unterbaueinheit (30);

Orientieren des Formungswerkzeugs (200) in der Unterbaueinheit (30), um das Formungswerkzeug (200) in wenigstens eines der mehreren verzweigenden Auslaßelemente (34, 36, 38) am zweiten Ende der Verzweigungskammer (32) einzuführen; und

Ausfahren des wenigstens einen der mehreren verzweigenden Auslaßelemente (34, 36, 38) mit dem Formungswerkzeug (200), bis das wenigstens eine der mehreren verzweigenden Auslaßelemente sich von einer Verbindung am zweiten Ende der Verzweigungskammer (32) längs eines Weges aus dem imaginären Zylinder erstreckt.

14. Verfahren nach Anspruch 13, bei dem das wenigstens eine der mehreren verzweigenden Auslaßelemente (34, 36, 38) in der eingefahrenen Position **gekennzeichnet ist durch** eine nicht kreisförmige radiale Querschnittsform, wobei der Ausfahrsschritt den folgenden Unterschritt umfaßt:

Ausfahren des wenigstens einen der mehreren verzweigenden Auslaßelemente (34, 36, 38) mit dem Formungswerkzeug (200), bis das wenigstens eine der mehreren verzweigenden Auslaßelemente **gekennzeichnet ist durch** eine im wesentlichen kreisförmige radiale Querschnittsform.

15. Verfahren nach Anspruch 14, bei dem der Ausfahr-
schritt die weiteren Unterschritte des Ausfahrens ei-
ner Mehrzahl der mehreren verzweigenden Ausla-
ßelemente (34, 36, 38) mit dem Formungswerk-
zeug (200) umfaßt, bis jedes der Mehrzahl der meh-
reren verzweigenden Auslaßelemente (34, 36, 38)
gekennzeichnet ist durch eine im wesentlichen
kreisförmige radiale Querschnittsform und jedes
der Mehrzahl der mehreren verzweigenden Ausla-
ßelemente (34, 36, 38) sich von einer Verbindung
am zweiten Ende der Verzweigungskammer (32)
längs eines Weges aus dem imaginären Zylinder
erstreckt.
16. Verfahren nach Anspruch 15, bei dem die Unter-
schritte des Ausfahrens einer Mehrzahl der mehre-
ren verzweigenden Auslaßelemente (34, 36, 38) mit
dem Formungswerkzeug (200) gleichzeitig ausge-
führt werden.
17. Verfahren nach Anspruch 13, bei dem der Ausfahr-
schritt mehrere Unterausfahrsschritte umfaßt, wobei
der erste Unterausfahrsschritt bei der Verbindung
des wenigstens einen der mehreren verzweigen-
den Auslaßelemente (34, 36, 38) mit der Verzwei-
gungskammer (32) beginnt und mehrere weitere
Unterausfahrsschritte in entsprechend größeren Ab-
ständen von der Verbindung des wenigstens einen
der mehreren verzweigenden Auslaßelemente (34,
36, 38) mit der Verzweigungskammer (32) ausge-
führt werden.
18. Mehrfach verzweigende Unterbaueinheit (30) mit
einer Vorrichtung (100, 200) zum Ausfahren und
Bilden eines Auslasses (34, 36, 38) der mehrfach
verzweigenden Unterbaueinheit (30) in einem ver-
schalten Bohrloch, wobei die Unterbaueinheit (30)
eine Verzweigungskammer (32) mit einem ersten
Ende, einem zweiten Ende und mehreren verzwei-
genden Auslaßelementen (34, 36, 38) enthält, wo-
von jedes mit dem zweiten Ende der Verzweigungs-
kammer (32) verbunden ist, wobei sich die verzwei-
genden Auslaßelemente (34, 36, 38) in einem ein-
gefahrenen Zustand befinden, in dem sich jedes
der Auslaßelemente (34, 36, 38) im wesentlichen
vollständig innerhalb eines imaginären Zylinders
befindet, der zum ersten Ende der Verzweigungs-
kammer (32) coaxial ist und im wesentlichen den
gleichen Radius wie dieses besitzt, wobei die Vor-
richtung (100, 200) umfaßt:

eine Antriebs- und Steuereinheit (100) im obe-
ren Teil des Bohrlochs;
eine Funktionseinheit (200) im unteren Teil des
Bohrlochs; und
eine elektrische Drahtleitung (110), die zwi-
schen der Antriebs- und Steuereinheit (100) im
oberen Teil des Bohrlochs und der Funktions-
einheit (200) im unteren Teil des Bohrlochs an-
geschlossen ist, um einen Weg für elektrische
Leistung und elektrische Kommunikationssi-
gnale zwischen ihnen zu schaffen;

wobei die Funktionseinheit (200) im unteren
Teil des Bohrlochs einen Formungsmechanismus
(122, 124, 126) enthält, der so beschaffen und ent-
worfen ist, daß er in ein eingefahrenes verzweigen-
des Auslaßelement (34, 36, 38) der Unterbauein-
heit (30) eingeführt werden kann, um wenigstens
eines der mehreren Auslaßelemente (34, 36, 38)
auszufahren, so daß es sich längs eines Weges von
der Verzweigungskammer (32) aus dem imaginä-
ren Zylinder erstreckt.

19. Unterbaueinheit (30) und Vorrichtung (100, 200)
nach Anspruch 18, wobei die Funktionseinheit
(200) im unteren Teil des Bohrlochs umfaßt:

Mittel (210) zum Verriegeln der Funktionsein-
heit (200) im unteren Teil des Bohrlochs an ei-
ner vorgegebenen axialen Position innerhalb
der mehrfach verzweigenden Unterbaueinheit
(30); und

Mittel (212) zum radialen Orientieren des For-
mungsmechanismus (122, 124, 126) in der
Weise, daß der Formungsmechanismus (122,
124, 126) auf ein ausgewähltes verzweigendes
Auslaßelement (34, 36, 38) der Unterbauein-
heit (30) ausgerichtet ist.

20. Unterbaueinheit (30) und Vorrichtung (100, 200)
nach Anspruch 19, wobei die Funktionseinheit
(200) im unteren Teil des Bohrlochs ferner umfaßt:

eine Hydraulikpumpe (206) für die Druckbeauf-
schlagung von Hydraulikfluid; und
einen Kopf (213), der Hydraulikfluidleitungen
besitzt, die mit der Hydraulikpumpe (206) ver-
bunden sind; und

wobei
der Formungsmechanismus (122, 124, 126)
ein hydraulisch betätigtes Formungskissen (123,
125, 127) und ein Verbindungsglied (152) zwischen
dem Formungskissen (123, 125, 127) und dem
Kopf (213) enthält, um dem Formungskissen (123,
125, 127) mit Druck beaufschlagtes Hydraulikfluid
zuzuführen.

21. Unterbaueinheit (30) und Vorrichtung (100, 200) nach Anspruch 20, wobei der Formungsmechanismus (122, 124, 126) einen Kolben (151) enthält, der das Formungskissen (123, 125, 127) nach außen gegen das Auslaßelement (34, 36, 38) zwingt. 5
22. Unterbaueinheit (30) und Vorrichtung (100, 200) nach Anspruch 20, wobei das Formungskissen (1520) eine geneigte innere Oberfläche besitzt und der Formungsmechanismus (1500) Rollen (1522) enthält, die mit dem Verbindungsglied (1526) gekoppelt sind, um mit der geneigten inneren Oberfläche zusammenzuwirken, um das Formungskissen (1520) nach außen gegen das Auslaßelement (1560, 1562) zu zwingen. 10 15
23. Unterbaueinheit (30) und Vorrichtung (100, 200) nach Anspruch 22, die ferner einen ausfahrenden Aktuator enthalten, der einen Zylinderkörper (1516), der mit dem Formungskissen (1520) mittels eines Schwenkgliedes (1524) verbunden ist, sowie einen mit den Rollen (1522) mittels einer Stange (1526) gekoppelten Kolben (1518) besitzt. 20
24. Unterbaueinheit (30) und Vorrichtung (100, 200) nach Anspruch 23, die ferner einen Bewegungsaktuator (1510) enthalten, der einen Kolben (1512) enthält, der strukturell und hydraulisch mit dem Zylinderkörper (1516) des ausfahrenden Aktuators verbunden ist. 25 30
25. Verfahren zum Formen eines Abzweigbohrlochs (801) von einem Hauptbohrloch, das umfaßt:
- Bewegen einer Verzweigungsunterbaueinheit (30) mit einer Verzweigungskammer (32) und mehreren verzweigenden Auslässen (34, 36, 38) zusammen mit einer Hauptverschalung (604) durch ein Hauptbohrloch zu einer Verzweigungsstelle; 35 40
- Orientieren der Verzweigungsunterbaueinheit (30), bis ihre mehreren verzweigenden Auslässe (34, 36, 38) in einer vorgegebenen Orientierung angeordnet sind; und
- Ausfahren und Formen wenigstens eines der mehreren verzweigenden Auslässe (34, 36, 38), bis er längs eines Weges über den Durchmesser der Verzweigungskammer (32) hinaus ausgefahren ist und eine im wesentlichen runde Form annimmt. 45 50
26. Verfahren nach Anspruch 25, bei dem der Ausfahr- und Formungsschritt an einer Mehrzahl von mehreren verzweigenden Auslässen (34, 36, 38) ausgeführt wird, bis jeder der Mehrzahl der mehreren verzweigenden Auslässe (34, 36, 38) längs eines Weges über den Durchmesser der Verzweigungskammer (32) hinaus ausgefahren ist. 55
27. Verfahren nach Anspruch 26, das ferner die folgenden Schritte umfaßt:
- Verstopfen jedes der mehreren verzweigenden Auslässe (34, 36, 38);
- Formen eines Abzweigbohrlochs (801) durch einen ausgewählten (36) der mehreren verzweigenden Auslässe (34, 36, 38);
- Installieren einer im wesentlichen runden Verkleidung (805) in dem Abzweigbohrloch (801); und
- Abdichten eines Endes der im wesentlichen runden Verkleidung (805) mit dem im wesentlichen runden Ende des ausgewählten (36) der mehreren verzweigenden Auslässe (34, 36, 38).
28. Verfahren nach Anspruch 27, bei dem die Abdichtung des Endes der Verkleidung (805) in bezug auf einen ausgewählten (36) der mehreren verzweigenden Auslässe (34, 36, 38) mittels eines hängenden Dichtungsstücks (806) erfolgt.
29. Verfahren nach Anspruch 27, das ferner die folgenden Schritte umfaßt:
- Formen eines Abzweigbohrlochs (801, 808) durch eine Mehrzahl von mehreren verzweigenden Auslässen (36, 38);
- Installieren einer im wesentlichen runden Verkleidung (805, 810) in jedem der Mehrzahl der mehreren verzweigenden Auslässe (36, 38); und
- Abdichten eines Endes jeder der im wesentlichen runden Verkleidungen (805, 810) mit einem entsprechenden Ende eines der Mehrzahl der mehreren Verzweigungsauslässe (36, 38).
30. Verfahren nach Anspruch 29, das ferner die folgenden Schritte umfaßt:
- Installieren eines Bohrlochkrümmers (612) in der Verzweigungskammer (32);
- Fertigstellen jedes Abzweigbohrlochs (801, 808); und
- Steuern der Produktion jedes Abzweigbohrlochs (801, 808) zum Hauptbohrloch mit dem Krümmer (612).
31. Verfahren nach Anspruch 27, das ferner den Schritt des Verzögerns des Formens eines Abzweigbohrlochs (808) durch wenigstens einen der mehreren verzweigenden Auslässe umfaßt, um dadurch einen verzweigenden Auslaß für eine künftige Bohrlochentwicklung zu reservieren.
32. Verfahren nach Anspruch 29, das ferner die folgenden Schritte umfaßt:

Einleiten eines erwärmten Fluids in wenigstens eines der Abzweigbohrlöcher (801, 802), um die Reservoir-Strömung zu steigern; und Erzeugen von Kohlenwasserstofffluid von einem weiteren der mehreren Abzweigbohrlöcher (801, 808) von einem Reservoir, in das erwärmtes Fluid eingeleitet worden ist.

Revendications

1. Appareil pour le tubage d'un sondage, cet appareil comprenant
 - une colonne de tubage de puits (604) ; et
 - une réduction de ramification multiple (30) sur le côté le plus bas de ladite colonne de tubage de puits (604), **caractérisée en ce que** ladite réduction de ramification multiple (30) comporte
 - une chambre de ramification (32) ayant une première extrémité ouverte de forme cylindrique et une seconde extrémité, ladite chambre de ramification (32) étant en connexion étanche à ladite première extrémité avec ledit tubage de puits (604) ; et
 - des éléments de sortie de ramification multiple (34, 36, 38) dont chacun est intégralement relié à ladite seconde extrémité de ladite chambre de ramification (32), chacune desdits éléments de sortie de ramification multiple (34, 36, 38) étant en communication fluide avec ladite chambre de ramification (32), ladite réduction (30) étant **caractérisée par** :
 - une position rétractée pour insertion dans ledit sondage dans lequel chacun desdits éléments de sortie de ramification multiple (34, 36, 38) est essentiellement totalement dans un cylindre imaginaire qui est coaxial à et sensiblement de même rayon que ladite première extrémité de ladite chambre de ramification (32) ; et
 - une position élargie où au moins un desdits éléments de sortie de ramification multiple (34, 36, 38) part de ladite chambre de ramification (32) suivant une trajectoire extérieure dudit cylindre imaginaire.
2. Appareil selon la revendication 1, **caractérisé en ce que**
 - lesdits éléments de sortie de ramification multiple (34, 36, 38) sont conçus et disposés de telle sorte qu'à ladite position élargie, chacun desdits éléments de sortie multiple (34, 36, 38) part suivant une trajectoire en arc à partir de ladite chambre de ramification (32) vers l'extérieur dudit cylindre imaginaire.
3. Appareil selon la revendication 1 ou revendication 2, **caractérisé en ce que** :
4. Appareil selon la revendication 1 ou revendication 2 **caractérisé en ce que** :
 - chacun desdits éléments de sortie de ramification multiple (34, 36, 38) dans ladite position rétractée est **caractérisé par** une forme en section transversale radiale non circulaire ; et
 - au moins un desdits éléments de sortie de ramification multiple (34, 36, 38) dans ladite position élargie est **caractérisé par** une forme en section transversale radiale sensiblement circulaire.
5. Appareil selon l'une quelconque des précédentes revendications, **caractérisé en ce que** :
 - lesdits éléments de sortie de ramification multiple (34, 36, 38) sont faits d'une matière qui peut être déformée plastiquement par formage à froid.
6. Appareil selon la revendication 5 **caractérisé en ce que** ladite matière est un acier allié à structure austénitique.
7. Appareil selon la revendication 6 **caractérisé en ce que** ladite matière est un alliage de nickel.
8. Appareil selon l'une quelconque des précédentes revendications, **caractérisé en ce que** chacun desdits éléments de sortie de ramification multiple (34, 36, 38) est sensiblement de même surface en section transversale radiale.
9. Appareil selon l'une quelconque des précédentes revendications, **caractérisé en ce que** :
 - au moins un desdits éléments de sortie de ramification multiple (34, 36, 38) est **caractérisé par** une surface en section transversale radiale qui est supérieure à au moins un autre desdits éléments de sortie de ramification multiple (34, 36, 38).
10. Appareil selon l'une quelconque des précédentes revendications, **caractérisé en ce que** lesdits éléments de sortie à ramification multiple comprennent

cinq sorties (541, 542, 543, 544, 545), où une desdites sorties (545) est **caractérisée** par une surface en section transversale radiale qui est inférieure à quatre (541, 542, 543, 544) desdits éléments de sortie de ramification multiple.

5

11. Appareil selon l'une quelconque des précédentes revendications, comprenant de plus :

un élément tige (170) porté sensiblement axialement vers le bas à partir de ladite seconde extrémité de ladite chambre de ramification (32) ; et

10

un pied (172) disposé à une extrémité distale de ladite tige (170).

15

12. Appareil selon l'une quelconque des revendications 1 à 10 **caractérisé en ce que** :

une zone de support centrale (150) est définie à ladite seconde extrémité de ladite chambre de ramification (32) entre les connexions solitaires desdits éléments de sortie de ramification multiple (34, 36, 38) à ladite seconde extrémité, et comprenant de plus ;

20

une tige d'extension (170) portée par ladite zone de support centrale (150) qui est disposée axialement au delà desdits éléments de sortie à ramification multiple (34, 36, 38) ; et

25

un pied (172) disposé à une extrémité distale de ladite tige (170).

30

13. Procédé d'installation d'une réduction de ramification multiple (30) dans un sondage où ladite réduction (30) comporte une chambre de ramification (32) ayant une première extrémité cylindrique et une seconde extrémité, et des éléments de sortie de ramification multiple (34, 36, 38) dont chacun est relié à ladite seconde extrémité de ladite chambre de ramification (32) et qui sont disposés en position rétractée où chacun desdits éléments de sortie de ramification multiple (34, 36, 38) est pratiquement totalement dans un cylindre imaginaire qui est coaxial à, et sensiblement de même rayon que, ladite première extrémité cylindrique de ladite chambre de ramification (32), le procédé comprenant les étapes de :

35

40

45

connexion de ladite première extrémité de ladite chambre de ramification (32) de ladite réduction (30) à une extrémité inférieure d'une colonne de tubage (604) ;

50

le passage de ladite colonne de tubage (604) et de ladite réduction (30) dans un sondage à une position de noeud où un sondage de ramification (801) doit être prévu ;

55

le passage d'un outil de mise en forme (200) dans ladite colonne de tubage (604) dans ladite

chambre de ramification (32) de ladite réduction (30) ;

l'orientation dudit outil de mise en forme (200) dans ladite réduction (30) afin d'introduire ledit outil de mise en forme (200) dans au moins un desdits éléments de sortie de ramification multiple (34, 36, 38) à ladite seconde extrémité de ladite chambre de ramification (32) ; et l'expansion d'au moins un desdits éléments de sortie de ramification multiple (34, 36, 38) avec ledit outil de mise en forme (200) jusqu'à ce qu'au moins un desdits éléments de sortie de ramification multiple parte d'une connexion à ladite seconde extrémité de ladite chambre de ramification (32) suivant une trajectoire vers l'extérieur dudit cylindre imaginaire.

14. Dans le procédé selon la revendication 13 où au moins un desdits éléments de sortie de ramification multiple (34, 36, 38) en position dite rétractée est **caractérisé par** une forme en section transversale radiale non circulaire, ladite étape d'expansion comportant la sous-étape de :

expansion d'au moins un desdits éléments de sortie de ramification multiple (34, 36, 38) avec ledit outil de mise en forme (200) jusqu'à ce qu'au moins un desdits éléments de sortie de ramification multiple soit **caractérisé par** une forme en section transversale radiale sensiblement circulaire.

15. Procédé selon la revendication 14, **caractérisé en ce que** l'étape d'expansion comprend les autres sous-étapes d'expansion des divers éléments de sortie de ramification multiple (34, 36, 38) avec ledit outil de mise en forme (200) jusqu'à ce que chacun desdits divers éléments de sortie de ramification multiple (34, 36, 38) soit **caractérisé par** une forme en section transversale radiale sensiblement circulaire et chacun des divers éléments de sortie de ramification multiple (34, 36, 38) parte d'une connexion à ladite seconde extrémité de ladite chambre de ramification (32) suivant une trajectoire vers l'extérieur dudit cylindre imaginaire.

16. Procédé selon la revendication 15, **caractérisé en ce que** lesdites sous-étapes d'expansion de plusieurs éléments de sortie de ramification multiple (34, 36, 38) avec ledit outil de mise en forme (200) sont réalisées simultanément.

17. Procédé selon la revendication 13, **caractérisé en ce que** ladite étape d'expansion comporte plusieurs étapes de sous-expansion, la première étape de sous-expansion commençant à la connexion d'au moins un desdits éléments de sortie de ramification multiple (34, 36, 38) à ladite chambre de ramifica-

tion (32) et avec des étapes complémentaires de sous-expansion multiples réalisées à des distances relativement plus importantes de ladite connexion d'au moins un desdits éléments de sortie de ramification multiple (34, 36, 38) à ladite chambre de ramification (32),

18. Réduction de ramification multiple (30) avec un appareil (100, 200) pour élargir et former une sortie (34, 36, 38) de ladite réduction de ramification multiple (30) dans un sondage tubée, où ladite réduction (30) comprend une chambre de ramification (32) ayant une première extrémité, une seconde extrémité, et des éléments de sortie de ramification multiple (34, 36, 38) dont chacun est relié à ladite seconde extrémité de ladite chambre de ramification (32), lesdits éléments de sortie de ramification (34, 36, 38) étant à l'état rétracté où chacun desdits éléments de sortie (34, 36, 38) est pratiquement totalement dans un cylindre imaginaire qui est coaxial à et a sensiblement le même rayon que ladite première extrémité de ladite chambre de ramification (32), ledit appareil (100, 200) comprenant :

un groupe d'alimentation et de commande d'orifice supérieur (100) ;
un groupe d'exploitation d'orifice inférieur (200) ; et
un câble de forage électrique (110) relié entre ledit groupe d'alimentation et de contrôle d'orifice supérieur (100) et ledit groupe d'exploitation d'orifice inférieur (200) pour assurer une trajectoire pour les signaux de communication électrique et d'alimentation électrique entre eux ;
ledit groupe d'exploitation d'orifice inférieur (200) comprenant un mécanisme de mise en forme (122, 124, 126) disposé et conçu pour insertion dans un élément de sortie de ramification rétracté (34, 36, 38) de ladite réduction (30) pour élargir au moins un desdits éléments de sortie multiple (34, 36, 38) de telle sorte qu'il soit disposé dans une trajectoire partant de ladite chambre de ramification (32) vers l'extérieur dudit cylindre imaginaire.

19. Réduction (30) et appareil (100, 200) selon la revendication 18, **caractérisés en ce que** ledit groupe d'exploitation d'orifice inférieur (200) comprend :

un moyen (210) pour le verrouillage dudit groupe d'exploitation d'orifice inférieur (200) à une position axiale prédéterminée dans ladite réduction de ramification multiple (30) ; et
un moyen (212) pour orienter radialement ledit mécanisme de mise en forme (122, 124, 126) de telle sorte que ledit mécanisme de mise en forme (122, 124, 126) soit aligné avec un élé-

ment de sortie de ramification sélectionné (34, 36, 38) de ladite réduction (30).

20. Réduction (30) et appareil (100, 200) selon la revendication 19, **caractérisés en ce que** ledit groupe d'exploitation d'orifice inférieur (200) comprend de plus :

une pompe hydraulique (206) pour mettre sous pression le fluide hydraulique ; et
une tête (213) ayant des canalisations de fluide hydraulique reliées à ladite pompe hydraulique (206) ; et

caractérisés en ce que

ledit mécanisme de mise en forme (122, 124, 126) comporte un patin de mise en forme à commande hydraulique (123, 125, 127) et une liaison (152) entre ledit patin de mise en forme (123, 125, 127) et ladite tête (213) pour fournir du fluide hydraulique sous pression audit patin de mise en forme (123, 125, 127).

21. Réduction (30) et appareil (100, 200) selon la revendication 20, **caractérisés en ce que** ledit mécanisme de mise en forme (122, 124, 126) comprend un piston (151) pour forcer ledit patin de mise en forme (123, 125, 127) vers l'extérieur contre ledit élément de sortie (34, 36, 38).

22. Réduction (30) et appareil (100, 200) selon la revendication 20, **caractérisés en ce que** ledit patin de mise en forme (1520) comprend une surface intérieure inclinée et ledit mécanisme de mise en forme (1500) comprend des galets (1522) accouplés à ladite liaison (1526) pour coopérer avec ladite surface intérieure inclinée pour forcer ledit patin de mise en forme (1520) vers l'extérieur contre ledit élément de sortie (1560, 1562),

23. Réduction (30) et appareil (100, 200) selon la revendication 22, comprenant de plus un dispositif de commande d'expansion ayant un corps de cylindre (1516) accouplé audit patin de mise en forme (1520) au moyen d'une liaison par pivotement (1524) et ayant un piston (1518) accouplé auxdits galets (1522) au moyen d'une tige (1526).

24. Réduction (30) et appareil (100, 200) selon la revendication 23, comprenant de plus un dispositif de commande de déplacement (1510) comprenant un piston (1512) qui est relié structurellement et hydrauliquement audit corps de vérin (1516) dudit dispositif de commande d'expansion.

25. Procédé de mise en forme de puits de ramification (801) à partir d'un puits de base comprenant :

- le passage d'une réduction de ramification (30) ayant une chambre de ramification (32) et des sorties de ramification multiple (34, 36, 38) avec un tubage de base (604) par un puits de base vers un emplacement de ramification ; l'orientation de ladite réduction de ramification (30) jusqu'à ce que ses sorties de ramification multiple (34, 36, 38) soient disposées avec une orientation prédéterminée ; et l'expansion et la mise en forme d'au moins une desdites sorties de ramification multiple (34, 36, 38) jusqu'à ce qu'elle suive une trajectoire au delà du diamètre de ladite chambre de ramification (32) et ait une forme sensiblement ronde.
26. Procédé selon la revendication 25, **caractérisé en ce que** ladite étape d'expansion et mise en forme est réalisée sur plusieurs sorties de ramification multiple (34, 36, 38) jusqu'à ce que chacune des diverses sorties de ramification multiple (34, 36, 38) suive une trajectoire au-delà dudit diamètre de ladite chambre de ramification (32).
27. Procédé selon la revendication 26 comprenant de plus les étapes de :
- obturation de chacune desdites sorties de ramification multiple (34, 36, 38);
 - formation d'un sondage de ramification (801) par une sortie sélectionnée (36) desdites sorties de ramification multiple (34, 36, 38) ;
 - installation d'une chemise sensiblement ronde (805) sur ledit sondage de ramification (801) ;
 - et
 - étanchéité d'une extrémité de ladite chemise sensiblement ronde (805) à une dite extrémité sensiblement ronde d'une (36) desdites sorties de ramification multiple (34, 36, 38).
28. Procédé selon la revendication 27, **caractérisé en ce que** ladite étanchéité de ladite extrémité de ladite chemise (805) par rapport à ladite sortie sélectionnée (36) desdites sorties de ramification multiple (34, 36, 38) est effectuée au moyen d'une garniture de suspension de chemise (806).
29. Procédé selon la revendication 27 comprenant de plus les étapes de:
- formation d'un sondage de ramification (801, 808) par plusieurs desdites sorties de ramification multiple (36, 38) ;
 - installation d'une chemise sensiblement ronde (805, 810) sur chacune des diverses sorties de ramification multiple (36, 38) ; et
 - étanchéité d'une extrémité de chacune desdites chemises sensiblement rondes (805, 810)
- par rapport à une extrémité correspondante d'une des diverses sorties de ramification multiple (36, 38).
30. Procédé selon la revendication 29, comprenant de plus les étapes de :
- installation d'un collecteur d'orifice inférieur (612) dans ladite chambre de ramification (32) ;
 - exécution de chaque sondage de ramification (801, 808) ; et
 - contrôle de la production de chaque sondage de ramification (801, 808) au puits de base avec ledit collecteur (612).
31. Procédé selon la revendication 27 comprenant de plus l'étape du report de formation d'un sondage de ramification (808) par au moins une desdites sorties de ramification multiple et donc réservation d'une sortie de ramification pour le développement futur de puits.
32. Procédé selon la revendication 29 comprenant de plus les étapes de :
- injection d'un fluide chauffé dans au moins un desdits sondages de ramification (801, 808) pour améliorer le débit du réservoir ; et
 - production de fluide hydrocarbure à partir d'un autre desdits sondages de ramification multiple (801, 808) à partir d'un réservoir dans lequel le fluide chauffé a été injecté.
